A tensor can be of several types:

- `torch.float16`, `torch.float32`, `torch.float64`,
- `torch.uint8`,
- `torch.int8`, `torch.int16`, `torch.int32`, `torch.int64`

and can be located either in the CPU's or in a GPU's memory.

Operations with tensors stored in a certain device's memory are done by that device. We will come back to that later.
>>> x = torch.zeros(1, 3)
>>> x.dtype, x.device
(torch.float32, device(type='cpu'))
>>> x = x.long()
>>> x.dtype, x.device
(torch.int64, device(type='cpu'))
>>> x = x.to('cuda')
>>> x.dtype, x.device
(torch.int64, device(type='cuda', index=0))

2d tensor (e.g. grayscale image)

3d tensor (e.g. rgb image)

4d tensor (e.g. sequence of rgb images)
Here are some examples from the vast library of tensor operations:

**Creation**
- `torch.empty(*size, ...)`
- `torch.zeros(*size, ...)`
- `torch.full(size, value, ...)`
- `torch.tensor(sequence, ...)`
- `torch.eye(n, ...)`
- `torch.from_numpy(ndarray)`

**Indexing, Slicing, Joining, Mutating**
- `torch.Tensor.view(*size)`
- `torch.cat(inputs, dimension=0)`
- `torch.chunk(tensor, nb_chunks, dim=0)[source]`
- `torch.split(tensor, split_size, dim=0)[source]`
- `torch.index_select(input, dim, index, out=None)`
- `torch.t(input, out=None)`
- `torch.transpose(input, dim0, dim1, out=None)`

**Filling**
- `Tensor.fill_(value)`
- `torch.bernoulli_(proba)`
- `torch.normal_(mu, [std])`

**Pointwise math**
- `torch.abs(input, out=None)`
- `torch.add()`
- `torch.cos(input, out=None)`
- `torch.sigmoid(input, out=None)`
- `(+ many operators)`

**Math reduction**
- `torch.dist(input, other, p=2, out=None)`
- `torch.mean()`
- `torch.norm()`
- `torch.std()`
- `torch.sum()`

**BLAS and LAPACK Operations**
- `torch.eig(a, eigenvectors=False, out=None)`
- `torch.lstsq(B, A, out=None)`
- `torch.inverse(input, out=None)`
- `torch.mm(mat1, mat2, out=None)`
- `torch.mv(mat, vec, out=None)`
x = torch.tensor([ [ 1, 3, 0 ],
                  [ 2, 4, 6 ] ]) # Output:

x.t() # Output:

x.view(-1) # Output:

x.view(3, -1) # Output:

x[:, 1:3] # Output:

x.view(1, 2, 3).expand(3, 2, 3) # Output:

x = torch.tensor([ [ [ 1, 2, 1 ],
                    [ 2, 1, 2 ] ],
                   [ [ 3, 0, 3 ],
                     [ 0, 3, 0 ] ] ]) # Output:

x[0:1, :, :] # Output:

x[:, :, 0:2] # Output:

x.transpose(0, 1) # Output:

x.transpose(0, 2) # Output:

x.transpose(1, 2) # Output:

x[1:3] # Output:
PyTorch offers simple interfaces to standard image data-bases.

```python
import torch, torchvision
cifar = torchvision.datasets.CIFAR10('./cifar10/', train = True, download = True)
x = torch.from_numpy(cifar.data).permute(0, 3, 1, 2).float() / 255
print(x.dtype, x.size(), x.min().item(), x.max().item())
```

prints

```
Files already downloaded and verified
torch.float32 torch.Size([50000, 3, 32, 32]) 0.0 1.0
```

# Narrows to the first images, converts to float
x = x.narrow(0, 0, 48)

# Saves these samples as a single image
torchvision.utils.save_image(x, 'cifar-4x12.png',
    nrow = 12, pad_value = 1.0)
# Switches the row and column indexes
x.transpose_(2, 3)
torchvision.utils.save_image(x, 'cifar-4x12-rotated.png',
    nrow = 12, pad_value = 1.0)

# Kills the green and blue channels
x.narrow(1, 1, 2).fill_(0)
torchvision.utils.save_image(x, 'cifar-4x12-rotated-and-red.png',
    nrow = 12, pad_value = 1.0)
Broadcasting automagically expands dimensions by replicating coefficients, when it is necessary to perform operations that are “intuitively reasonable”.

For instance:

```python
>>> x = torch.empty(100, 4).normal_(2)
>>> x.mean(0)
tensor([2.0476, 2.0133, 1.9109, 1.8588])
>>> x -= x.mean(0)  # This should not work!
>>> x.mean(0)
tensor([-4.0531e-08, -4.4703e-07, -1.3471e-07, 3.5763e-09])
```
Precisely, broadcasting proceeds as follows:

1. If one of the tensors has fewer dimensions than the other, it is reshaped by adding as many dimensions of size 1 as necessary in the front; then
2. for every dimension mismatch, if one of the two tensors is of size one, it is expanded along this axis by replicating coefficients.

If there is a tensor size mismatch for one of the dimension and neither of them is one, the operation fails.

```python
A = torch.tensor([[1.], [2.], [3.], [4.]])
B = torch.tensor([[5., -5., 5., -5., 5.]])
C = A + B
```
To deal with complex operations, PyTorch provides a dimension naming mechanism:

```python
>>> seq = torch.empty(100, 3, 1024, names = [ 'n', 'c', 't' ]).normal_
>>> seq.mean('t').size()
torch.Size([100, 3])
>>> time_first = seq.align_to('n', 't', 'c')
torch.Size([100, 1024, 3])
>>> array = seq.flatten( [ 'c', 't' ], 'i' )
torch.Size([100, 3072])
>>> array.names
( 'n', 'i' )
```
